

KRANTHI KUMAR REDDY ANNAPUREDDY – SOFTWARE DEVELOPER

Canada | kranthia24@gmail.com | +1 (782) 882 7765 | [GitHub](#) | [LinkedIn](#)

PROJECTS

Core Technologies: Java, Spring Boot, Spring Security, Git, Docker, Maven, Gradle, MySQL, PostgreSQL

Core Tools: IntelliJ, Postman, VSCode, DBeaver

Gateway

October 2025 - Present

Technologies: Reactive WebFlux

- Designed a single entry point using **Spring Cloud Gateway** to handle dynamic routing, path predicates, and load balancing from an **Angular** frontend to downstream microservices.
- Configured the gateway as an **OAuth2 Resource Server** to validate **JWT** tokens at the edge, mitigating unauthorized access and abstracting the internal microservice topology.
- Implemented cookie-based **CSRF protection** tailored for reactive architectures, seamlessly syncing CSRF tokens with the client to prevent cross-site request forgery attacks.
- Eliminated configuration bloat by centralizing cross-origin resource sharing (**CORS**) and error mitigation policies directly at the gateway layer.

Authorization Server

January 2026 - Present

Technologies: JJWT, Cryptography

- Built a custom authentication server using **io.jsonwebtoken**, leveraging a **PKCS12** KeyStore to handle secure **RSA** public/private key cryptographic signing.
- Exposed a public **JWKS** endpoint (`/.well-known/jwks.json`) to allow the API Gateway and downstream resource servers to independently fetch public keys and verify **JWT** validity.
- Engineered a **multi-tenant** authentication framework that injects tenant context directly into JWT claims, enforcing data isolation at the perimeter.
- Developed an enterprise **RBAC** engine mapping custom roles and explicit privileges to users, establishing strict claim-based authorization across the ecosystem.

Data Management

December 2025 - Present

- Engineered an Angular dashboard integrated with **HTTP Interceptors** to automatically inject OAuth2 Bearer Tokens into API requests and manage global error states.
- Built an **OAuth2 Resource Server** utilizing **JWKS** for asymmetric JWT token verification, enforcing **tenant-based** isolation and Role-Based Access Control (**RBAC**) across a microservices ecosystem.
- Eliminated manual production **SQL** updates by building a validated API layer with automated user auditing.
- Protected database connection pools by disabling **OSIV**, cleanly resolving lazy-loading risks by mapping **JPA** entities to Java Records within `@Transactional` service boundaries.
- Extracted core data models and custom exceptions into a version-controlled, shared enterprise utility library published on **GitHub**.
- Leveraged **Angular Signals** to manage fine-grained, reactive UI state across the data dashboard, optimizing rendering performance and eliminating complex RxJS subscription overhead for synchronous data flows.

Portfolio

June 2025 - Present

- Automated **CI/CD** using **GitHub Actions**, reducing develop-to-deploy time by 80%.
- Deployed a **Dockerized API** on **Render**, powering a **GitHub Pages**-hosted Angular application with live data.
- Configured backend as an **OAuth2 Resource Server** to handle secure token validation and endpoint authorization via an external auth server.
- Designed a secure, decoupled full-stack infrastructure integrating a managed **PostgreSQL** database with **Spring Data JPA**.
- Engineered a high-resilience frontend data layer using **Angular Signals**, implementing a custom **HTTP interceptor** with dynamic timeout scaling (up to 90s) to gracefully handle backend cloud container latency while maintaining an uninterrupted **UX**.
- Optimized application performance and network overhead by designing a single-query unified payload strategy, caching crucial system state reactively to minimize redundant downstream **API** pressure.
- Leveraging **Lombok** to reduce boilerplate and implementing structural logging configurations for long-term production auditing.

Shared Library

March 2026 - Present

- Designed, developed, and published a decoupled, version-controlled library to **GitHub Packages**, enforcing strict *DRY* principles and eliminating redundant boilerplate across enterprise microservices.
- Designed a zero-configuration auto-configure architecture. Dynamically separated bean definitions via conditional annotations for both *SERVLET*, *REACTIVE* environments, enabling seamless single-dependency activation.
- Built a unified, cross-stack error-handling hierarchy and a custom abstract `BaseException` class (extends ***RuntimeException***), standardizing global, immutable error payloads across all hosting applications.
- Standardized data transport layers by leveraging **Java 17 Records** alongside reusable utility classes and custom validation groups (`CreateValidation`, `UpdateValidation`) to enforce consistent runtime request parsing.
- Maintained strict library decoupling using `<optional>true</optional>` scopes.

EDUCATION

Master of Engineering in Internetworking

September 2023 - May 2025

Dalhousie University, Halifax, NS

- Relevant Courses: Programming in Internetworking (Python, Docker, CI/CD pipelines).

Bachelor of Engineering in Electrical and Electronics Engineering

June 2016 - September 2020

Anna University, R.M.D. Engineering College, India

- Relevant Courses: Object Oriented Programming (C, C++, Java languages and Algorithms).

EXPERIENCE

Freelancer

September 2025 - October 2025

Software Developer

- Proposed and documented a scalable ***Micro Frontend architecture*** for an Angular application using ***Module Federation***, establishing the integration blueprints and configuration standards for cross-team module sharing.
- Integrated dynamic Angular components from static HTML templates provided by the ***UI/UX*** team, ensuring seamless integration of business requirements and wireframes into production-ready interfaces.

SoWeDid Software Solutions, Hyderabad, India

October 2020 - May 2023

Software Developer

- Refactored outdated codebases to adopt modern frameworks and design patterns, enhancing maintainability and reducing technical debt.
- Built and optimized ***Elasticsearch queries and indexes***, reducing search response time by 30% and supporting faster data retrieval across applications.
- Designed and optimized ***BIRT reports***, improving performance and delivering insights to 100+ business users with reduced report generation time.
- Implemented and customized Angular `DataTables` to handle large datasets efficiently, delivering advanced features like server-side pagination, multi-column sorting, and dynamic filtering for end-users.
- Integrated ***RESTful APIs*** with Angular application, using ***JSON***, enabling seamless data flow and real-time updates for end-users.
- Maintained session-based authentication using ***Spring Security and HTTP Sessions*** and login workflows with an ***Angular application*** for secure user access.
- Documented ***Liquibase*** workflows and best practices, making it smooth on-boarding for the new team members and improving database release cycle by 25%.
- Worked in ***Agile*** development environments with regular sprint planning, code reviews and collaborative development workflows.
- Investigated and resolved software issues by analyzing root causes and implementing effective solutions.
- Quickly learned new technologies and adapted to evolving project requirements.
